The filling machine developed relatively late and is a kind of packaging machinery and equipment. It is mainly a small class of products in packaging machines, but its manufacturing technology is not simple. Briefly introduce its manufacturing technology: it contains photoelectric automatic control sauce filling machine, countable quantitative pure water filling machine, wireless remote control mobile automatic filling machine; the structure has a filling machine star wheel clamp, fresh Beer filling machine; under the vacuum cover, there is a residual liquid recovery device of the filling machine, a filling machine sealing vacuum lifting device, a vacuum filling machine, a vacuum filling machine punching device; a **liquid filling machine** uses an adjustable flow control valve, a cup separating mechanism for a beverage filler, a cup dropping device for a paper cup filler, a preformed cup lid film conveying device for the filler, and a new type of automatic filling machine metering device.

In fact, the classification of filling machines is also very simple, with different functions and different classifications. From the perspective of packaging materials, it can be divided into liquid filling machines, paste filling machines, powder filling machines, and granule filling machines; from the degree of production automation Lectures are divided into semi-automatic filling machines and automatic filling production lines. The liquid filling machine can be divided into normal pressure filling machine, pressure filling machine and vacuum filling machine according to the filling principle. Some filling machines can be subdivided, for example: sauce filling machines are mainly suitable for the thick and concentrated chili sauce, watercress, peanut butter, sesame sauce, jam, butter base, red oil hot pot Filling of sticky sauces such as base materials. But according to the operation process, it can be divided into full-automatic filling machine and semi-automatic filling machine. Some DY series filling machines are semi-automatic piston filling machines, which mainly use a cylinder to drive a piston to extract and eject materials. Use a check valve to control the material flow direction, and use a magnetic reed switch to control the cylinder stroke to adjust the filling volume .

Liquid Filling Machine unknown

Liquid Filling Machine

How does the **sauce filling machine** clean and disinfect?

1. Thoroughly clean before operation. Wipe off oil or dirt with a soft non-woven cloth and cleaning agent, and then wipe dry with a soft non-woven cloth.
 2. In accordance with GMP requirements, check whether the contact parts of equipment and materials meet the corresponding cleanliness requirements.
 3. Keep the chilli sauce filling machine's pipes clean. All pipes, especially those in direct or direct contact with the materials, must be kept clean. They must be cleaned weekly, water must be taken every day, and sterilized each time.
 4. Make sure that the filling machine is clean. Brush and sterilize the material tank to ensure that the parts in contact with the material are free from dirt and bacteria.
 5. In the production process, it is the best method to ensure the biological stability of bottled hot pepper paste. The time and temperature of sterilization must be controlled to ensure the final effect.
-

6. Clean each part of the machine surface after each use, and add clean lubricant to each activity department.

7. It should be scrubbed once a week, especially the places that are not easy to be cleaned in normal use or blown with compressed air.

Our company has been focusing on sauce filling machines, automatic sauce filling machines, sauce filling production lines, and provides various types of filling machines, chili sauce filling machines, mushroom sauce filling machines, seafood sauce filling Machine and so on. The liquid filling machine has a simple and reasonable structure, high accuracy, and easier operation. It is an ideal choice for many companies to fill high-level tasks. The role of the filling machine cannot be underestimated. It not only occupies an important position in the market, but also can give enterprises more important To higher efficiency.
