Tadarise 2.5 mg is a medication used to treat erectile dysfunction (ED) in men. It contains the active ingredient tadalafil, which belongs to a class of drugs called phosphodiesterase type 5 (PDE5) inhibitors. Tadalafil works by relaxing the blood vessels in the penis, allowing for increased blood flow, which leads to an erection during sexual stimulation. It helps men with ED achieve and maintain an erection sufficient for sexual activity. The dosage of Tadarise 2.5 mg refers to the strength of tadalafil in each tablet. The recommended starting dose for most men with ED is usually 10 mg, taken prior to anticipated sexual activity. However, depending on individual response and tolerability, the dose may be adjusted by a healthcare professional. It's important to note that Tadarise 2.5 mg is a prescription medication, and you should only use it under the guidance and supervision of a healthcare provider.
