Before getting into anything let us know what big data is? Many organizations and business related companies analyze computationally and uncover valuable sets of large or big data which helps in adding valuable information to them. These sets of data information which are relatively large are known as big data.

Many large companies are officially gathering a huge amount of data information every day. These data information are so large in number that they cannot be manipulated with conventional data processing techniques. Thus many organizations and companies use big data to store analyze and share data information in big data. These companies and organizations every second record a huge amount of information. The four V's of big data are velocity, volume, variety, and veracity.
